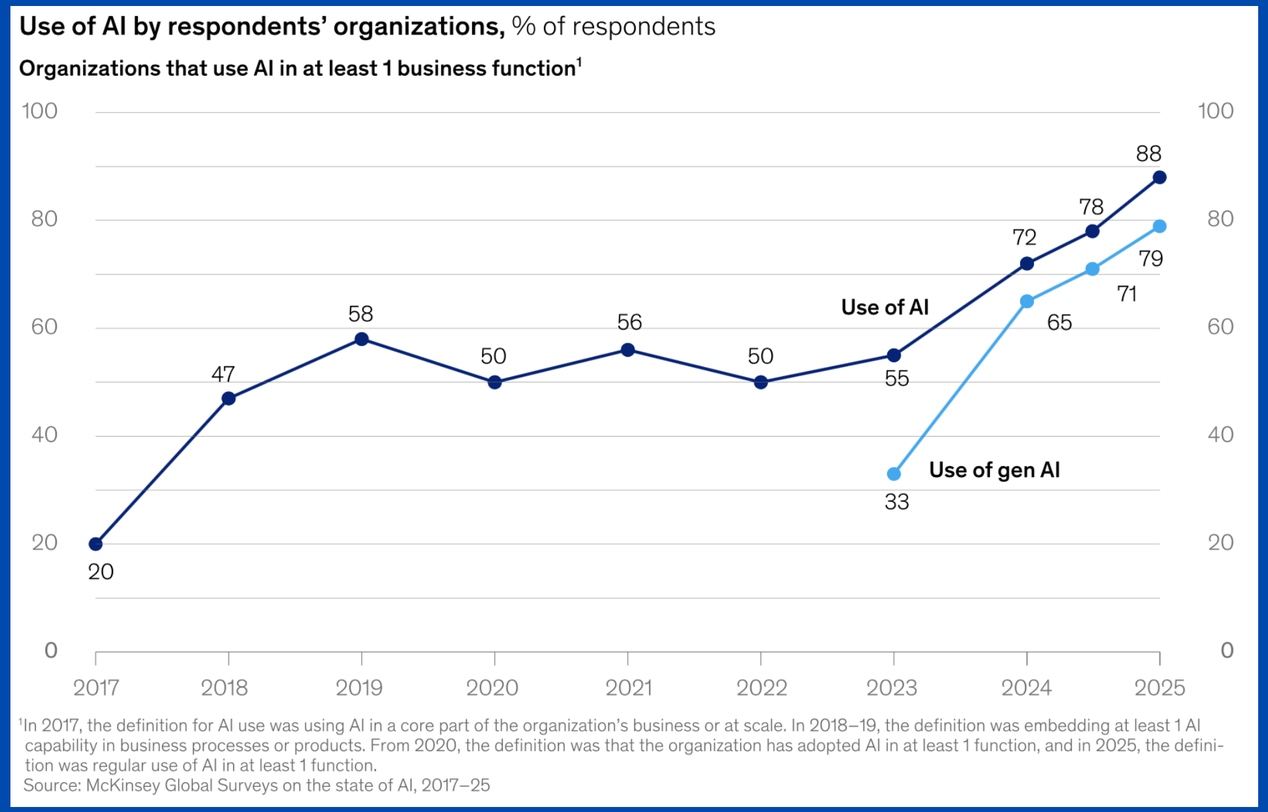
# LLM, AI Agent Adoption Explosion

### High AI Adoption

88% of enterprises are using AI in at least one function (McKinsey, 2025)

### Low Agent Deployment

Up to 40% of enterprise applications will include integrated task-specific agents by 2026, up from less than 5% today (Gartner, 2025)



# AI Agents Are a Different Problem

**Traditional Software**

- Deterministic
- Predictable

**LLM & AI Agents**

- Non-deterministic
- Autonomous
- Multi-step
- External tools

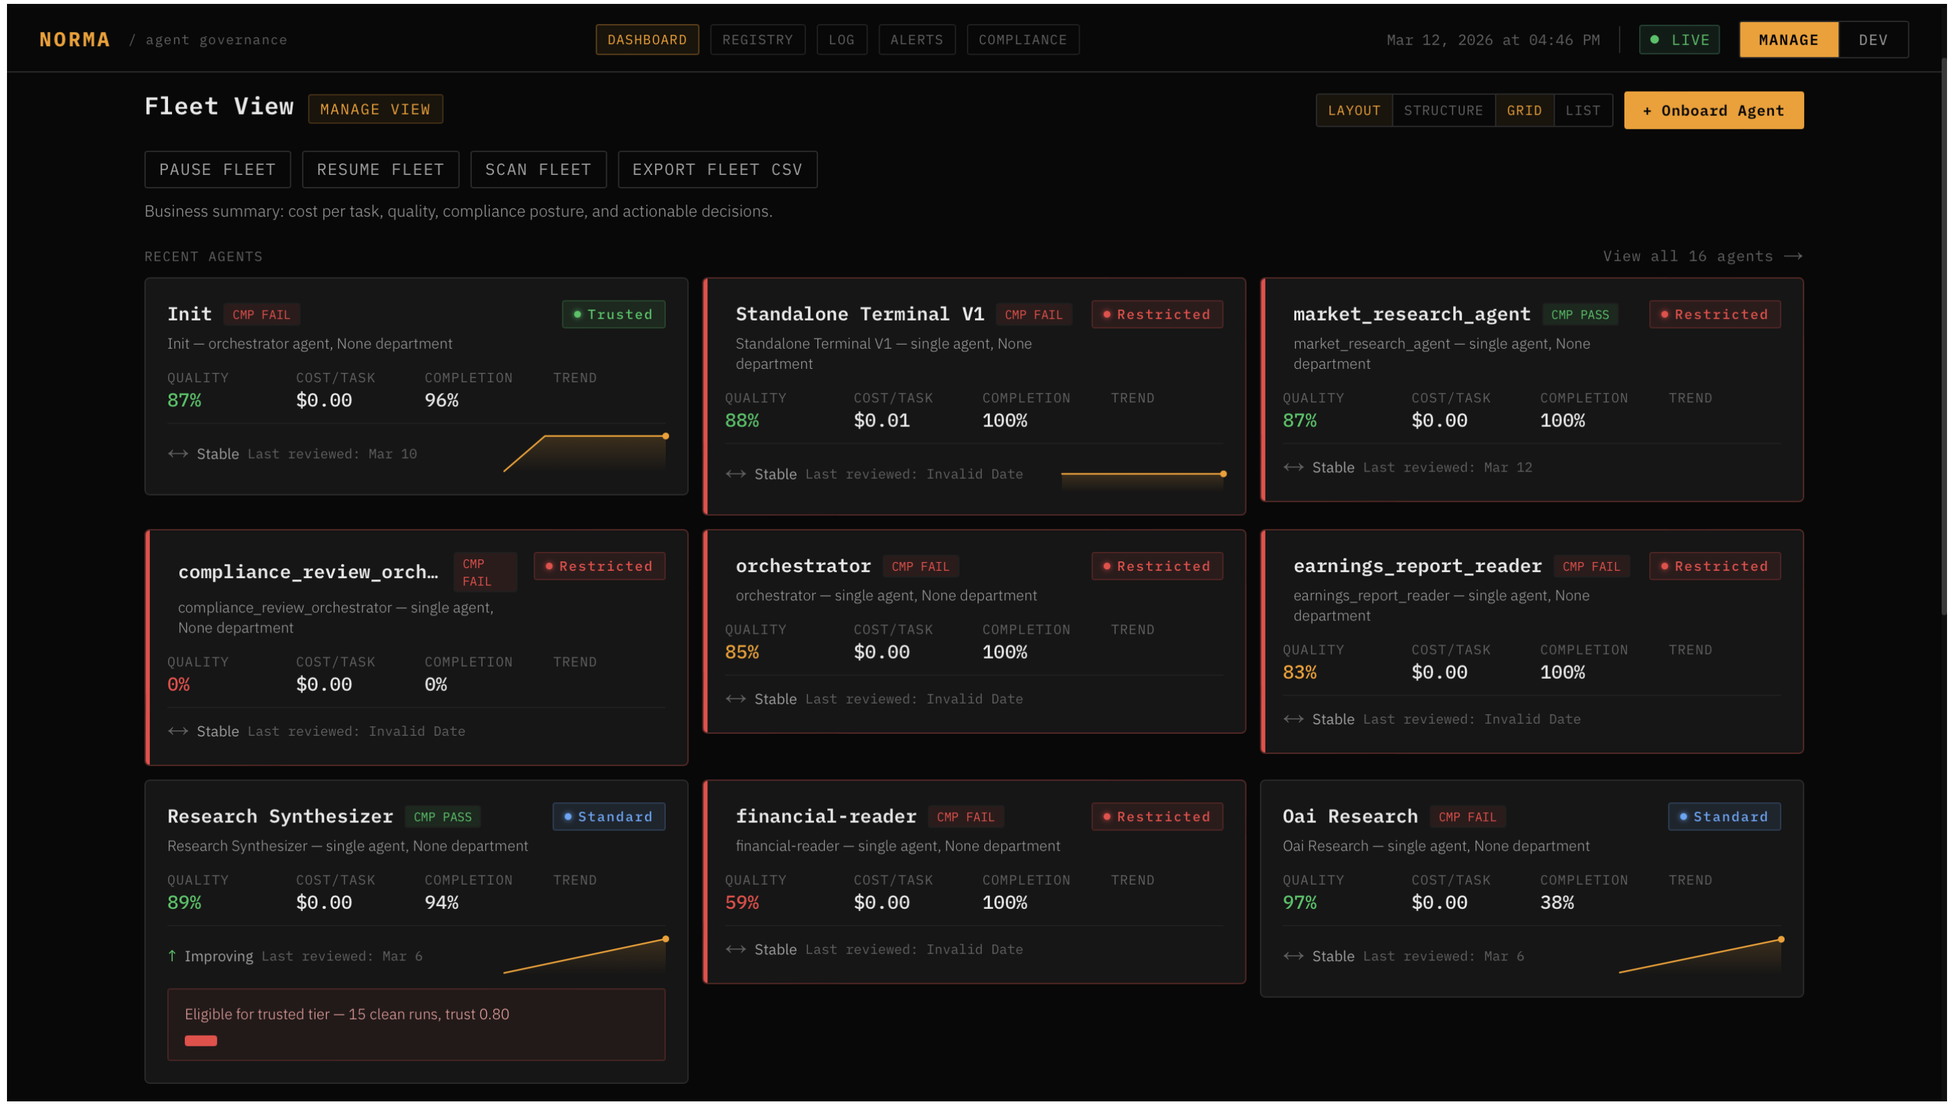
# Enterprise Today Can’t Answer These Questions

1. Which agents are performing well — and at what cost per task?

2. What is each agent allowed to do, and did they violate anything in production?

3. When behavior changed after a model swap or prompt update — did you know?

# Introducing norma.ai



**Observability, guardrails, and evaluation for enterprise AI agents. On one platform.**

# What's Working Today

- Agent onboarding via AST code scan
- LLM-generated governance **contracts** (GPT-4o + human review)
- Real-time **enforcement** (tool ACL, data path, PII, cost SLA, latency SLA)
- Full run **telemetry**: spans, tokens, latency, model, tool calls
- Remote agents monitoring through norma-watch CLI and Otel, HTTP, SSE
- Anomaly Detection & Fault Attribution
- **LLM-as-judge** quality scoring with rubrics
- **Compliance** posture: OWASP LLM Top 10, NIST AI RMF, EU AI Act
- Conversational LLM Chatbot for query in plain English, grounded strictly in run telemetry.
- Compatible with LangChain, LangGraph, OpenAI, CrewAI, AutoGen

# thank you
